### Quick reference flowchart on completing ear syringing assessment

For quick reference the guide below is a summary of actions required.

#### 1. Introduction

The purpose of this document is to provide guidance to District Nurses in relation to the assessment of patients requiring ear care and ear syringing. The procedure can only be carried out by a Registered Nurse who has attended the Trust Ear Syringing Course and been assessed as possessing the appropriate competencies (appendix 1). Registered Nurses who have undertaken training in examination of the ear canal can undertake this procedure without the patient seeing the GP, providing that they feel confident and competent to do so and they undertake a full assessment using the assessment tool (appendix 2).

Standard principles of infection control should be adhered to when conducting this procedure.

#### 2. Definition

Ear syringing is the irrigation of the external auditory canal of the ear with lukewarm water using a Propulse II machine.

#### 3. Indications and Contraindications for use

Ear syringing should not be undertaken on adult patients with a hearing aid in the affected ear, unless they have been seen and referred by an audiologist who has approved the ear syringing procedure, or on children. These patients should be referred to their GP for referral to an Ear, Nose and Throat (ENT) Department.

Ear syringing is a last resort treatment. Patients should be advised to instil 1-2 drops of olive oil eardrops into the affected ear up to 3 times a day for a minimum of 1-2 weeks prior to syringing. Preventative care has been proven to reduce the necessity to syringe patients' ears.

Patients should then be advised to continue with 1-2 drops of olive oil weekly into the affected ear to prevent the build-up of cerumen.

Preventative and maintenance treatment should be first line management. Nurses should be advising patients as per 'Looking after your ears' leaflet.

Ear irrigation should not be carried out if:

- There were previous complications following this procedure in the past.
- There is any history of middle ear infection in the six weeks beforehand.
- The patient has undergone any form of ear or head surgery in the last 18 months.
- The patient has ever had a perforation or history of mucous discharge in the previous year.
- The patient has a cleft palate.
- There is any evidence of acute otitis externa with pain and tenderness of the pinna.
- The patient has profound deafness in one ear (unless seen by the Audiology Department who has requested ear syringing).
- Or if patient has not instilled olive oil prior to the procedure as requested.

#### 4. Training

Community nurses will need to undertake theoretical and practical training for ear syringing, comprising of a one-day in-house ear syringing workshop that considers the following issues:

- Anatomy and physiology of the ear
- Accountability
- Prevention of ear problems
- Examination of ear canal
- Patient education and minor cerumen problems
- Practical undertaking ear syringing
- Assessment and record keeping

All staff undertaking ear syringing must have been trained and mentored by the nominated team trainer and have had their clinical competence assessed on three occasions and be deemed safe practitioners to carry out the procedure.

#### 5. Equipment

The equipment of choice is the Propulse II – pulsed water unit. The use of metal aural syringes is not good practice, as the clinician has no means by which to safely regulate the pressure and flow of the water in to the ear.

**Note**: When using electricity-powered equipment in patients' homes the nurse should be aware of any potential hazards posed by frayed electric wires or faulty sockets.

| Otoscope and range of disposable speculae | Waterproof covering                               |
|---|---|
| Propulse II – pulsed water unit           | 100–200mls lukewarm tap water in suitable         |
|   | container   |
| Jobson Horne disposable probe             | Receiver / Noots Ear Tank                         |
| Disposable jet tip applicator             | Head lamp – VersaBrite (Pelican) or good lighting |
| Otoscope                                  | Cotton wool                                       |
| Disposable apron and gloves               |   |

#### 6. Maintenance and servicing of equipment

The Propulse II should be cleaned and serviced in accordance with the manufacturer's instructions and <u>medical devices policy</u>.

#### 7. Cleaning of equipment

#### **Propulse Electronic Irrigator**

**Stage 1:** Each day before use, the electronic irrigator must be disinfected using a solution, suggest use Chlor-Clean tablets, or similar, according to manufacturer's instructions, to get a solution which provides 1000 parts (NaDDC) per million (0.1%)

\*\*\*COSHH regulations must be observed when using NaDCC\*\*\*

Fill the water tank with NaDCC solution. Run the irrigator for a few seconds to allow the solution to fill the pump and flexible tubing. Leave to stand for 10 minutes.

Empty the water tank, then rinse the system through with tap water before use.

**Stage 2**: At the end of the day (or end of ear irrigation session), disinfect the irrigator for 10 minutes using the Chlor-Clean tablets. Rinse the machine by running through with well run cold tap water and dry thoroughly before leaving overnight.

**Explanation:** Sodium Hypochlorite 0.1% has only 1 Chlorine molecule and will release ALL this Chlorine if in contact with any vegetative matter. Sodium Dichloroisocyanurate (NaDCC) 0.1% has 2 Chlorine molecules which are slowly released, maintaining at all times 50% of its own weight. This is available in the form of Chlor-Clean tablets (Guest Medical) as per research completed by Dr David Coates from Q Laboratories Ltd, Preston in 2001. A covered litre container can be used to mix and store the solution for up to 8 hours. Chlor-Clean is mentioned particularly because it contains a surfactant (i.e. detergent) in addition to a disinfectant.

#### Disposable jet tips should be used

#### Other equipment

After each individual patient treatment, items of equipment should be disinfected as follows:

#### Speculum for Otoscope and Jobson Horne Probe

- Disposable speculae should be used.

#### **Noots Tank**

- Clean with detergent solution

- Rinse under hot water
- Dry thoroughly

Following cleaning, ALL equipment must be stored dry.

Any solution prepared for disinfecting equipment must be discarded at the end of each session / day.

Please remember that aural care and ear syringing are 'clean' - not 'sterile' procedures. However, you must ensure that ALL items of equipment used have been thoroughly cleaned and disinfected before use.

#### 8. Procedure

Outcome - patient will have optimum level of hearing. The necessity to re-syringe ears will have been reduced due to patients receiving information on aural care.

| Note | Action  | Rationale   |
|------|---|---|
| 1    | Undertake full assessment and ear examination using the ear-syringing assessment tool.  | To ensure that correct preparation has taken<br>place and there are no contraindications to<br>ear-syringing  |
| 2    | Explain and discuss the procedure including risks and benefits with the patient. Acquire verbal consent and document on the assessment sheet.   | To ensure that the patient understands the<br>procedure and gives their consent. Evidence<br>of patient involvement in assessment and<br>consent for any treatment is documented<br>appropriately.      |
| 3    | If the assessment indicates contra-<br>indication, refer to GP or Aural Clinic and do<br>not continue with ear syringing procedure.   | To prevent the risk of damage and / or possible litigation  |
| 4    | Prepare equipment ensuring that it has been appropriately cleaned as per guidance   | To minimise the risk of infection and ensure equipment is in working order  |
| 5    | <ul><li>a. Ask patient to sit with head in upright position.</li><li>b. Nurse should sit at the same level as patient.</li></ul>  | To facilitate the drainage of irrigation fluid. To ensure full view of the ear canal is facilitated.  |
| 6    | Check temperature of water is lukewarm (professional judgement)   | Irrigation fluid should be at body temperature to avoid triggering vestibular reflex.   |
| 7    | Run water through tubing (until runs warm)<br>of the Propulse II – starting at the minimum<br>speed, gradually building up to mid-point<br>(according to manufacturer's guidance).  | To ensure even flow of water without air<br>bubbles. To expel any air or cold water<br>remaining in the tube.   |
| 8    | Ensure that the tip of the Propulse II unit is firmly secure.   | The auditory canal may be damaged or the eardrum perforated if the tip 'flies off' under pressure from the water.   |
| 9    | Pull the pinna upwards and backwards and place the Noots container under the ear to collect the water and cerumen.  | To stretch and straighten the external auditory canal, to hold the ear steady and to prevent injury.  |
| 10   | Place tip of the Propulse II at the entrance to<br>meatus but do not occlude it, direct low<br>pressure stream of water (50 – 70mls)<br>towards the top and back of the canal gently<br>rotating in an arc from the upper posterior to<br>the upper anterior meatus (10 to-10 past) | Water should flow behind the cerumen plug<br>and back along the canal to wash it out; too<br>forceful a stream of water may force the plug<br>back along the canal or rupture the tympanic<br>membrane. |
| 11   | If the patient experiences vestibular reflex<br>(e.g. dizziness, nausea, coughing or water<br>down the nose) discontinue the irrigation.  | To prevent further triggering of the vestibular reflex.   |

| Note | Action  | Rationale   |
|------|---|---|
| 12   | Examine external meatus at regular intervals throughout the procedure to check if the cerumen has been removed.   | To determine position and size of cerumen plugs and monitor the condition of the ear.                                   |
| 13   | If removal of cerumen is difficult or has not<br>been removed after 1 tank of water, ask the<br>patient to continue with the olive oil eardrops<br>and return after 5-7 days.   | To minimise the risk of irritation or trauma to the external meatus.  |
| 14   | Ask patient to tilt head to allow water to<br>drain. Wrap cotton wool around the tip of the<br>Jobson Horne probe and 'dry out' auditory<br>canal – only dry out areas visible to the eye.<br>(Jobson Horne should only be used<br>following appropriate training). | To dry ear without irritating or damaging canal and to prevent potential infections developing.                         |
| 15   | Carry out final examination of ear with<br>otoscope. If any abnormality is observed<br>refer patient to GP / Ear Nose and Throat<br>(ENT) Department. Document outcomes of<br>syringing on assessment tool.   | To confirm removal of cerumen and monitor condition of external meatus and tympanic membrane.                           |
| 16   | Provide patient with 'Looking after your ears' leaflet.   | To reduce the necessity to re-syringe ears<br>and ensure patient is able to contact nurse if<br>they have any concerns. |

#### Appendix 1 – Staff training record

| Name               |   | Grade<br>of staff |  |
|--------------------|---|-------------------|--|
| Base               |   |                   |  |
| The above person a | attended a theory session on ear syringing on |                   |  |

The following topics were covered:

- Basic anatomy and physiology of the ear;
- Clinical guidance for ear syringing;
- Best practice e.g. documentation, equipment, run through of procedure;
- Awareness of leaflets and responsibilities for informed consent;
- Awareness of minor ear problems.

The learner has now completed their theoretical training.

| Assessor's name | Date |
|-----------------|------|
|-----------------|------|

The learner is now required to undertake at least three ear syringes with a qualified nurse who will sign off the learner's competency level.

I have observed the learner on three occasions and they are able to undertake the skill of ear syringing.

| Assessor's name | Grade |  |
|-----------------|-------|--|
| Signature       | Date  |  |

#### Appendix 2 - Ear syringing assessment tool

Before undertaking this assessment the patient must have had olive oil ear drops instilled into their ears at least once a day for a minimum of one week. If patient has not undertaken the correct preparation, give advice and rebook appointment for one week or next available appointment.

| Full name                 |            |  |
|---------------------------|------------|--|
| Address                   |            |  |
| Contact details           |            |  |
| Date of birth             | NHS Number |  |
| GP                        |            |  |
| Date / time of assessment |            |  |

Risks and benefits been explained to the patient.Patient has given consent to having their ear/ears syringed.

| History NB: Check patient's medical records                                       |  | Left Ear |     | Right Ear |  |
|---|--|----------|-----|-----------|--|
|   |  | No       | Yes | No        |  |
| Have olive oil drops been instilled as recommended?                               |  |          |     |           |  |
| Does the patient perceive to have reduced hearing due to wax?                     |  |          |     |           |  |
| *Have there been any problems previously with ear syringing?                      |  |          |     |           |  |
| *Has either eardrum ever been perforated?   |  |          |     |           |  |
| *Any previous infection/problems with ears  |  |          |     |           |  |
| *Pain in or around the ear/s  |  |          |     |           |  |
| *Discharge other than waxy discharge  |  |          |     |           |  |
| *Giddiness, nausea, itching or headache (please circle whichever                  |  |          |     |           |  |
| applies)  |  |          |     |           |  |
| *Ear surgery, i.e. cleft palate   |  |          |     |           |  |
| If you have a hearing aid, have you been seen and referred by an                  |  |          |     |           |  |
| audiologist for ear syringing?  |  |          |     |           |  |
| If the answer is no to the above triggers*, then proceed with the assessment.     |  |          |     |           |  |
| If the answer is yes to any of the above triggers*, then refer the patient to GP. |  |          |     |           |  |
|   |  |          |     |           |  |

| Examination assessment   | Left Ear Right |    | t Ear |    |
|--|----------------|----|-------|----|
| Check for signs of:  | Yes            | No | Yes   | No |
| Foreign bodies, i.e. cotton wool, foreign object, fluff                                      |                |    |       |    |
| Inflammation / Discharge   |                |    |       |    |
| Smell from ear/s   |                |    |       |    |
| Pain in or about ear when moving pinna around  |                |    |       |    |
| Any swelling in or around the ear  |                |    |       |    |
| Check for evidence of cerumen before proceeding (may be sticky, brown, flaky or hard yellow) |                |    |       |    |

I have had the procedure for ear syringing explained fully to me, have had the opportunity to ask any questions and give my consent to this procedure.

| Patient's | Date |  |

| Signature | Dale |  |

#### Outcome

If following assessment there are no identified problems and there is evidence of cerumen, then explain the procedure to the patient and proceed with ear syringing in accordance with Trust Guidance. If there are any problems on assessment refer patient to General Practitioner.
